# About Me

I am an emerging cybersecurity analyst with hands-on experience in threat analysis, incident response, Linux command-line operations, Python scripting, and security monitoring. Through the Google Cybersecurity Certificate and independent lab work, I've developed practical skills in SIEM investigation, log analysis, vulnerability identification, and risk assessment.

Before transitioning into cybersecurity, I worked in roles that required precision, confidentiality, and strong problem-solving — including front-desk operations, night auditing, and healthcare support. These positions strengthened my ability to manage sensitive information, maintain accuracy under pressure, and respond quickly to unexpected issues.

I am committed to continuous learning and focused on building a strong foundation in cybersecurity. My goal is to apply my analytical mindset, integrity, and technical skills in an entry-level cybersecurity or security operations role where I can contribute to protecting systems and data while growing professionally.

# Projects

I will add my cybersecurity projects here soon. This section will include labs, scripts, SIEM investigations, and hands-on security work.

## SIEM Log Analysis Lab

Placeholder text — you can describe how you investigated alerts, analyzed logs, and identified suspicious activity.

## Linux Security Hardening

Placeholder text — you can describe user management, permissions, firewall rules, or system auditing tasks.

## Python Automation Script

Placeholder text — you can describe a script that automates log parsing, password checks, or file monitoring.

## Incident Response Scenario

Placeholder text — you can describe how you identified, contained, and documented a simulated security incident.
